```

```
with ad2, not all the transcripts from this region have been characterized at the sequence level. the nine proteins given in features table below are not the only possible gene products (see the main adenovirus 2 entry).

large amounts of small rnas are produced from the vai and vail genes late in development for unknown reasons. [5] and [6] demonstrate that vai gene activity influences vali expression; that the 5' flank affects the start site of the rna but that an intragenic promoter (bases 10626 to 10690 below) determines whether the rna is actually produced; and that there is striking similarity between this rna and trans.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   /db_xref="UniProt/Swiss-Prot:P03255"

Claim 5; Page 180; 212pp; English.

New nucleic acid comprising an adenovirus tripartite leader nucleotide for producing high-capacity and targeted vectors for adenovirus-based gene therapy.

The specification describes a nucleic acid molecule comprising an adenovirus (AV) tripartite leader (TPL) nucleotide with a sequence comprising two different TPL exons or three same or different TPL exons. The nucleic acid is used to produce an adenovirus vector particle,

          vectors, target an adenovirus vector to a cell, produce a modified adenovirus, deliver a heterologous gene to an animal and produce a gutless adenoviral vector particle. The present sequence represents sequence, which is used to construct nucleic acid molecules of the invention. (Updated on 15-SEP-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Polynucleotide for making vectors, useful for treating ocular diseases, e.g., retinitis pigmentosa, comprises adenovirus inverter terminal repeat sequences, packaging signal and photoreceptor-specific promoter.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention provides an isolated polynucleotide comprising adenovirus (AV) inverter terminal repeat sequences (ITRS), AV packaging signal operatively linked to ITRS and a photoreceptor-specific promoter. A recombinant AV vector (AVV) comprising the polynucleotide is useful for targeted delivery of a gene product to the eye (especially to the vitreous cavity), for treating an ocular disease, e.g., retinal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Adenovirus; inverter terminal repeat sequence; ITRS; ocular disease; fiber protein; photoreceptor; rhodopsin; stargardt disease gene; STDG1; opthalmological; antiinflammatory; antidiabetic; cytostatic; enequese therapy; tripartite leader; TPL; ds.

degenerative disease, retinitis pigmentosa, Stargardt's disease, diabetic retinopathies, retinal vascularizations, and retinoblastoma of a mammal preferably human. The AAV comprises a fiber protein that specifically or selectively binds to receptors that are expressed on cells (preferably photoreceptors in the eye). Preferably, the recombinant virus comprise a chiber protein from an adenovirus type D subgroup or is a chimmeric protein containing a portion of the Nterminus of an adenovirus type 2 or type 5 penton, and the therapeutic product is a trophic factor, an anti-containing a portion of the Nterminus of an adenovirus type 2 or type 5 penton, and the therapeutic product is a trophic factor, an anti-corpusate disease gene (STDGI) an anti-cancer agent and a protein that regulates expression of a photoreceptor specific gene product. The viral nucleic acid of AAV comprises ITRS and packaging signal derived from AAV subgroup B or C, especially an AV type 2 or type 5. AAV is also useful for targeted gene therapy, where the vector comprises an AV type 37 fiber protein or its portion, and selectively transduces photoreceptors and delivers a gene product encoded by AAV. The present sequence represents a deenovius 5 tripartite lander (TPL) nucleotide sequence. (Updated on 07-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   120

The invention describes an isolated nucleic acid (I) comprising
adenovirus inverted terminal repeat sequence, an adenovirus packaging
conder. A Recombinant adenovirus vector (II) comprising (I) is useful
convoicer. A Recombinant adenovirus vector (II) comprising (I) is useful
for targeted delivery of a gene product to the eye of a mammal which
convoices administering (II) that comprises heterologous DNA encoding the
gene product or resulting in expression of the gene product, where the
recombinant virus comprises a fibre protein that specifically or
recombinant virus comprises a fibre protein that specifically or
convoiced to the eye. The recombinant virus comprises a fibre
protein which is an adenovirus type 37, from an adenovirus type D
convoiced to a nadenovirus type 2 or type 5 penton, and a sufficient
cof the N-termins of an adenovirus type 2 or type 5 penton, and a sufficient
cof the N-termins of an adenovirus type 2 or type 5 penton, and a sufficient
cof the N-termins of an adenovirus type 2 or type 5 penton, and a sufficient
contain which is an adenovirus type 2 or type 5 penton, and a sufficient
contain which is chosen from trophic factor, anti-apoptotic factor, gene encoding
a rhodopsin protein, wild-type Stargardt disease gene (STGGI), an anti-
concer agent and a protein that regulates expression of a photoreceptor-
concer agent and a protein that regulates expression of a photoreceptor-
conlar disease such as retinal degenerative disease e.g., retinial
conlar disease such as retinal degenerative disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         inverted terminal repeat (ITR) sequences, and an adenovirus packaging signal operatively linked to the sequence. The ITRs and packaging signal are derived from an adenovirus serotype B or C, or adenovirus type 2 or 5. The viral nucleic acid further comprises a photoreceptor-specific promoter. (II) includes photoreceptor promoters providing a means not only for specific targeting of expression in these cells, but also for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  . (tripartite leader sequence) from the adenovirus type 5 genome, used enhance the expression of complementing adenoviral proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              photoreceptor-restricted transgene expression. Novel isolated nucleic acid molecule useful for delivering heterologous gene to human or any animal, or for producing gutless adenoviral vector particle.

Claim 14; SEQ ID NO 32; 157pp; English.

The invention describes an isolated nucleic acid molecule (I) comprising an adenovirus tripartite leader (TPL) nucleotide, the TPL nucleotide an adenovirus tripartite leader (TPL) nucleotide, the TPL nucleotide comprising a first and second different TPL exons chosen from second and third same or different TPL exons, the TPL exons chosen from complete or partial TPL exon 1, complete TPL exon 2 and complete TPL exon 3. (I) is useful for delivering a patterologous gene to a human or any animal, or for producing a gutless adenoviral vector particle. A recombinant adenovirus particle (II) is useful for delivery of an amount of (II) sufficient to infect the cell. A helper-independent of the second in an adenovirus vector genome (III) is useful for producing an adenovirus vector particle containing (III) which involves containing particles and harvesting the particle produced by the cell of packaging of the genome and (III) which is deficient in expressing sufficient functional fiber protein to support assembly of fiber containing particles and harvesting the particle produced by the cell involves complementing a missing fiber gene of (III) or helper-dependent complements recombinant adenovirus vector genome by expressing in packaging colls a fiber gene from a different adenoviral serotype than the recombinant adenovirus vector to a cell of choice. (I) is useful for reducing proliferation of tumour cells in a subject, or disorder, and for reducing proliferation of tumour cells in a subject, or adenovirus to the particle of tumour cells in a subject, or adenovirus to the particle of tumour cells in a subject, or adenovirus to the particle of tumour cells in a subject, or adenovirus to the particle of tumour cells in a subject, or adenovirus to the particle of tumour cells in a subject, or adenovirus to the particle of tumour cells in a subject, or adenovirus to the particle of tumour cells in a subject, or adenovirus to the particle of tumour cells in a subject, or adenovirus to the particle of tumour cells in a subje to disrupt HIV infection. This sequenc Adenovirus tripartite leader sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The specification describes a nucleic acid molecule comprising an adenovirus (AV) tripartite leader (TPL) nucleotide with a sequence comprising two different TPL exons or three same or different TPL exons. The nucleic acid is used to produce an adenovirus vector particle, deliver an exogenous gene to a target cell, pseudotype recombinant viral vectors, target an adenovirus vector to a cell, produce a modified adenovirus, deliver a heterologous gene to an animal and produce a guiless adenovirus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               nucleic acid comprising an adenovirus tripartite leader nucleotide producing high-capacity and targeted vectors for adenovirus-based

The invention provides an isolated polynucleotide comprising adenovirus (AV) inverter terminal repeat sequences (ITRS), AV packaging signal coperatively linked to ITRS and a photoreceptor-specific promoter. A recombinant AV vector (AVV) comprising the polynucleotide is useful for targeted delivery of a gene product to the eye (especially to the vitreous cavity), for treating an ocular disease, e.g., retinal degenerative disease, retinal specularizations, and retinoblastoma, of a mammal preferably human. The AAV comprises a fiber protein that specifically or selectively binds to receptors that are expressed on cells (preferably photoreceptors in the eye). Preferably, the recombinant virus comprise a fiber protein from an adenovirus type D subgroup or is a chimeric protein containing a portion of the N-terminus of an adenovirus type 2 or type 5 penton, and the therapeutic product is a trophic factor, an anticappated disease gene (GTDG1), an anticancer agent and a protein that regulates expression of a photoreceptor specific gene product. The viral cublic caid of AAV comprises ITRS and packaging signal derived from AAV subgroup B or C, especially an AV type 2 or type 5. AAV is also useful contained sequence represents contained sequence represents contained sequence of plasmid pbV80, an expression plasmid for administration of the nucleotide sequence of plasmid pbV80, an expression plasmid for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             e.g., retinitis pigmentosa, comprises adenovirus inverter terminal repeat sequences, packaging signal and photoreceptor-specific promoter.
                                                                                                                                                                                                                                                        Adenovirus; inverter terminal repeat sequence; ITRS; ocular disease; fiber protein; photoceceptor; rhodopsin; stargardt disease gene; STDG1; opthalmological; antiinflammatory; antidiabetic; cytostatic; gene therapy; fiber protein; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 7231 BP; 1751 A; 1807 C; 1869 G; 1804 T; 0 U; 0 Other;

A Recombinant adenovirus vector (II) comprising (I) is useful for targeted delivery of a gene product to the eye of a mammal which involves administering (II) that comprises heterologous DNA encoding the gene product or resulting in expression of the gene product, where the recombinant virus comprises a fibre protein that specifically or selectively binds to receptors that are expressed on cells which are photoreceptors, in the eye. The recombinant virus comprises a fibre protein which is an adenovirus type 37, from an adenovirus type D serotype. The fibre is a chimeric protein containing a sufficient portion of the N-terminus of an adenovirus type 2 or type 5 fibre protein for
                                                                                                                                                                                                                                                                                                                                                                                                                                                             ophthalmological; antiinflammatory; antidiabetic; gene therapy; ademovirus inverted terminal repeat sequence; adenovirus packaging signal; photoreceptor-specific promoter; adenovirus type 37; adenovirus type 9 serotype; adenovirus type 2; adenovirus type 5; photoreceptor; trophic factor; anti-apoptotic factor; rhodopini, wild-type Stargardt disease gene; STDG1; anti-cancer agent; retinal degenerative disease; retinitis pigmentosa; Stargardt's disease; diabetic retinopathy; retinal vascularisation; choroideraemia; photoreceptor-restricted transgene expression; photoreceptor-restricted transgene expression; recombinant adenovirus vector; adenovirus type 5; plasmid; cyclic;

interaction, with an adenovirus expression to the percent theory of a mammal. The encapsulated mucleic acid comprises a photoreceptor-specific promoter concapsulated mucleic acid comprises a photoreceptor-specific promoter operatively linked to a nucleic acid comprising the therapeutic product which is chosen from trophic factor, anti-apoptotic factor, gene encoding a rhodopsin protein, wild-type Stargard disease gene (STDGI), an anti-cancer agent and a protein that requiates expression of a photoreceptor-specific gene product. The delivery is effected for treatment of an coular disease such as retinal degenerative disease e.g., retinal coular disease such as retinal degenerative disease. Coular disease inherited and acquired retinal and neovascular certinoblastoma inherited and acquired retinal and neovascular degenerative diseases. The viral nucleic acid comprises an adenovirus packaging inverted terminal repeat (ITR) sequences, and an adenovirus packaging configuratively linked to the sequence. The ITRs and packaging signal care derived from an adenovirus serctype B or C, or adenovirus type 2 or configuratively linked to the sequence The ITRs and packaging signal care derived from an adenovirus serctype B or C, or adenovirus type 2 or configuration are derived from an adenovirus serctype B or C, or adenovirus type 2 or configuration of sphotoreceptor promoters providing a means not conly for specific targeting of expression in these cells, but also for photoreceptor-restricted transgene expression in the preparation of adamoniral care distances and an adenovirus provession of a adenovirus contraction of the sequence of the preparation of the adamoniral care distances and an adenovirus and adamonical care distances and an adenovirus and adamonical care distances and an adenovirus provession of the sequence of the preparation of the adamonical care distances and an adenovirus and adamonical care distances and an adenovirus provession of the adamonical care distances and an adenovirus provession of the adamonic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1328
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1448

The invention describes an isolated nucleic acid molecule (I) comprising an adenovirus tripartite leader (TPL) nucleotide, the TPL nucleotide an adenovirus tripartite leader (TPL) nucleotide, the TPL nucleotide comprising a first and second different TPL exons chosen first, second and third same or different TPL exons, the TPL exons chosen from complete or partial TPL exon 1, complete TPL exons chosen from complete or partial TPL exon 2 and complete TPL exon 3. (I) is useful for delivering a peterologous gene to a human or any animal, or for producing a gutless adenoviral vector particle. A recombinant adenovirus particle (II) is useful for delivery of an exogenous gene to a target cell which involves contacting the cell with an adenovirus vector particle containing (III) is useful for producing an adenovirus vector particle containing (III) which involves containing particles and harvesting the particles and harvesting the particles and harvesting the particles produced by the cell containing particles and harvesting recombinant adenovirus vector genome by expressing containing particles and harvesting recombinant viral vectors which involves complementing a missing fiber gene of (III) or helper-dependent cells a fiber gene from a different adenoviral serotype than the recombinant adenovirus vector genome by expressing in packaging cells a fiber gene from a different adenoviral serotype than the recombinant adenovirus vector (III) is abequit for specifically targeting an adenovirus vector to a cell of choice. (I) is useful for cecombinant adenovirus vector to a cell of choice. (I) is useful for treating diseases such as such as subject, or disorder, and for reducing proliferation of tumour cells in a subject, the disorder, and for reducing proliferation of tumour cells in a subject, or the contains the particle of the pace of the pac
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1148
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        180

The specification describes a nucleic acid molecule comprising an adenovirus (AV) tripartite leader (TPL) nucleotide with a sequence comprising two different TPL exons or three same or different TPL or the nucleic acid is used to produce an adenovirus vector particle, deliver an exogenous gene to a target cell, pseudotype recombinant vectors, target an adenovirus vector to a cell, produce a modified adenovirus, deliver a heterologous gene to an animal and produce a gutless adenovirus retor particle. The present sequence represents

plasmid pDV67, which contains a TPL

The invention provides an isolated polynucleotide comprising adenovirus (AV) inverter terminal repeat sequences (ITRS), AV packaging signal coperatively linked to ITRS and a photoreeptor-specific promoter. A recombinant AV vector (AVV) comprising the polynucleotide is useful for recombinant AV vector (AVV) comprising the polynucleotide is useful for targeted delivery of a gene product to the eye (especially to the confine to the sease, retinal and coular disease, e.g., retinal confines, retinal vascularizations, and retinoblastoma, of a mammal degenerative disease, retinitis pigmentosa, Stargardt's disease, diabetic retinopathies, retinal vascularizations, and retinoblastoma, of a mammal confirmation to receptors that are expressed on cells (preferably vector from an adenovirus type D subgroup or is a chimeric protein containing a portion of the N-terminus of an adenovirus type 2 or type 5 penton, and the therapeutic product is a trophic factor, an anti-cancer agent edisease gene (STDGI) an anti-cancer agent and a protein that regulates expression of a photoreceptor specific gene product. The viral concludes expression of a photoreceptor agent and a protein that comprises of the regulates expression of a photoreceptor specific gene product. The viral concludes agene therapy, where the vector comprises and the rageled gene therapy, where the vector comprises and the nucleotide sequence of plasmid pDV67, a plasmid containing adenoviral
                                                                                                                                                                                                                                                                                                                                          Polynucleotide for making vectors, useful for treating ocular diseases, e.g., retinitis pigmentosa, comprises adenovirus inverter terminal repeat sequences, packaging signal and photoreceptor-specific promoter.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 7960 BP; 1934 A; 2070 C; 1993 G; 1963 T; 0 U; 0 Other;

Synthetic.

The invention describes an isolated nucleic acid (I) comprising
adenovirus inverted terminal repeat sequence, an adenovirus packaging
conduct. A Recombinant adenovirus vector (II) comprising (I) is useful
conformatively linked to the sequence, and a photoreceptor-specific
promoter. A Recombinant adenovirus vector (II) comprising (I) is useful
conversed administering (II) that comprises heterologous DNA encoding the
conversed administering (II) that comprises heterologous DNA encoding the
compinant virus comprises a fibre protein that specifically or
conversed to receptors that are expressed on cells which are
protein which is an adenovirus type 37, from an adenovirus type D
conversed to a denovirus type 37, from an adenovirus type D
conversed to a nadenovirus type 2 or type 5 fibre protein for
interaction with an adenovirus type 2 or type 5 fibre protein for

concernatively linked to a nucleic acid comprising the therapeutic product
which is chosen from trophic factor, anti-isapprotic factor, gene encoding
cancer agent and a protein that requiates expression of a photoreceptorconcernative disease such as retinal degenerative disease e.g., retinal
conlar disease such as retinal degenerative disease e.g., retinal
conlar disease such as retinal degenerative disease an adenovirus
conlar disease such as retinal degenerative disease an adenovirus
conlar disease such as retinal degenerative disease an adenovirus
conlar disease such as retinal degenerative disease an adenovirus
conlar disease such and adenovirus disease an adenovirus
conlar disease such and aden promoter. (II) includes photogeoceptor promoters providing a means not only for specific targeting of expression in these cells, but also for photoreoceptor-restricted transgene expression. This sequence represents an adenovirus fibre-expressing plasmid for complementation of fibre-genedeleted adenoviruses that also comprises the adenovirus tripartite leader inverted terminal repeat (ITR) sequences, and an adenovirus packaging signal signal operatively linked to the sequence. The ITRs and packaging signal are derived from an adenovirus serotype B or C, or adenovirus type 2 or 5. The viral nucleic acid further comprises a photoreceptor-specific Example 5; Page 82-86; 106pp; English. retinitis pigmentosa.

complete or partial TPL exon 1, complete TPL exon 2 and complete TPL exon 3. (I) is useful for delivering a heterologous gene to a human or any animal, or for producing a gutless adenoviral vector particle. A recombinant adenovirus particle (II) is useful for delivery of an exogenous gene to a target cell which involves contacting the cell with an amount of (II) sufficient to infect the cell. A helper-independent fiberpersory sector particle containing (III) which involves producing an adenovirus vector particle containing (III) which involves producing a packaging of the genome and (III) which is deficient in expressing containing particles and harvesting the particle produced by the cell containing particles and harvesting the particle produced by the cell containing particles and harvesting the particle produced by the cell containing particles and harvesting the particle produced by the cell containing particles and harvesting the particle produced by the cell involves complementing a missing fiber gene of (III) or helper-dependent fiber secombinant adenovirus vector. (III) is also useful for repeating to a denovirus vector to a cell of choice. (I) is useful for reducing proliferation of tumour cells in a subject, or confiscutt the leader sequence added to plasmid pCDN3/fibre to create plasmid confiscution. This sequence represents an adenovirus sequence represents an adenovirus of the complementation of E4-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1528

                                                                                                                                    The specification describes a nucleic acid molecule comprising an adenovirus (AV) tripartite leader (TPL) nucleotide with a sequence comprising two different TPL exons or three same or different TPL exons. The nucleic acid is used to produce an adenovirus vector particle, deliver an exogenous gene to a target cell, pseudotype recombinant viral vectors, target an adenovirus vector to a cell, produce a modified adenovirus, deliver a heterologous gene to an animal and produce a gutless adenoviral vector particle. The present sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                            09
                                  nucleic acid comprising an adenovirus tripartite leader nucleotide producing high-capacity and targeted vectors for adenovirus-based
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CTGAAAAGCGGGCATGACTTCTGCGCTAAGATTGTCAGTTTCCAAAAACGAGGAGGATTT

The invention provides an isolated polynucleotide comprising adenovirus (AV) inverter terminal repeat sequences (ITRS), AV packaging signal coperatively linked to TRS and a photoreceptor-specific promoter. A recombinant AV vector (AVV) comprising the polynucleotide is useful for recombinant AV vector (AVV) comprising the polynucleotide is useful for transparent and sease, e.g., retinal confidence of degenerative disease, retinitis pigmentosa, Stargardt's disease, diabetic retinopathies, retinal vacularizations, and retinoblastoma, of a mammal preferably human. The AAV comprises a fiber protein that specifically or selectively binds to receptors that are expressed on cells (preferably photoreceptors in the eye). Preferably, the recombinant virus comprise a fiber protein from an adenovirus type D subgroup or is a chimeric protein containing a portion of the Nterminus of an adenovirus type 2 or type 5 penton, and the therapeutic product is a trophic factor, an anticapport according a trophic factor, an anticapport according a trophic factor, an anticapport of a photoreceptor specific gene product. The viral capport according a from packaging signal derived from AAV cubering and according a protein from AAV cubering and product sease gene fargeted gene the vector comprises an AV type 37 fiber of the nucleotide sequence of plasmid pDV69, a plasmid containing a modified adamnial plantice of plasmid pDV69, a plasmid containing a modified
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1348

sequences, adenovirus packaging signals operatively linked to the sequences and photoreceptor-specific promoters, useful for treating retinitis pigmentosa. Novel nucleic acids comprising adenovirus inverted terminal repeat

Example 5; Page 86-90; 106pp; English.

The invention describes an isolated nucleic acid (I) comprising adenovirus inverted terminal repeat sequence, an adenovirus packaging signal operatively linked to the sequence, an adenovirus packaging signal operatively linked to the sequence, and a photoreceptor-specific promoter. A Recombinant adenovirus vector (II) comprising (I) is useful for targeted delivery of a gene product to the eye of a mammal which involves administering (II) that comprises heterologous DNA encoding the gene product or resulting in expression of the gene product, where the gene product or receptors that are expressed on cells which are photoreceptors, in the eye. The recombinant virus comprises a fibre protein which is an adenovirus type 37, from an adenovirus type D serotype. The fibre is a chimeric protein containing a sufficient portion of the N-terminus of an adenovirus type 2 or type 5 fibre protein for interaction with an adenovirus type 2 or type 5 pencon, and a sufficient portion of an adenovirus serotype D knob portion of the fiber for selective binding to photoreceptors in the eye of a mammal. The operatively linked to a nucleic acid comprising the therapeutic product which is chosen from trophic factor, anti-apoptotic factor, gene encoding a rhodopsin protein, wild-type Stargardt disease gene (STDG1), an antiphotoreceptor-restricted transgene expression. This sequence represents an adenovirus fibre-expressing plasmid for complementation of fibre-genedeleted adenoviruses that also comprises the adenovirus tripartite leader cancer agent and a protein that regulates expression of a photoreceptorspecific gene product. The delivery is effected for treatment of an
ocular disease such as retinal degenerative disease e.g., retinitis
pigmentosa, Stargardt's disease, diabetic retinopathies, retinal
vascularisation, choroideraemia, gyrate atrophy or macular dystrophy or
retinoblastoma inherited and acquired retinal and neovascular
degenerative diseases. The viral nucleic acid comprises an adenovirus inverted terminal repeat (ITR) sequences, and an adenovirus packaging signal signal operatively linked to the sequence. The ITRs and packaging signal are derived from an adenovirus service B or C, or adenovirus type 2 or 5. The viral nucleic acid further comprises a photoreceptor-specific only for specific targeting of expression in these cells, but also for includes photoreceptor promoters providing a means not sequence for enhancing the expression of complementing adenoviral promoter. (II) proteins.

ROSAPARY gene trap. The sequence tag is generated by 3'RACE and represents the 3' insertional cDNA flanking sequence. Additional information regarding this ES cell line and the insertion mutation is available upon request at https://www.fhorc.org/labs/soriano/GTdb/

Class: Gene Trap.

ROSAFARY gene trap. The sequence tag is generated by 3'RACE and represents the 3' insertional cDNA flanking sequence. Additional information regarding this Es cell line and the insertion mutation is available upon request at https://www.fhorc.org/labs/soriano/GTdb/
Class: Gene Trap.
